

Your Personalised Health Assessment Report

Your Personalised Health Assessment Report

PRIVATE & CONFIDENTIAL

Jane Smith

Your ref: **FHB74925A0**

Date: 08/07/2026

Dear Jane

Thank you for choosing **DCA - TEST DOMAIN**.

We would always advise you to discuss any health or wellbeing concerns you have with your GP in addition to the information provided in this report.

Please take your time reading through the full report. A simple flag system of green, amber and red as illustrated below should make the report easier for you to follow. An information flag is also used for any sections of interest which are not based directly from your results.

No concerns

Summary

Thank you for completing your preventative health pre-screening questionnaire.

Your responses have now been reviewed by our clinical team as part of the DCA protect health programme.

Based on the information provided, we believe you would benefit from progressing to the next stage of the programme: DCA Corporate Advanced.

This does not mean a serious health problem has been found. It means that understanding your health in more detail will allow us to provide the most effective, personalised recommendations and to identify any opportunities for early intervention. You will receive a personalised health report with your results explained clearly, along with a follow-up GP video appointment.

Further assessment allows us to build a more complete picture of your current health and identify opportunities to support your long-term wellbeing.

As part of DCA Corporate Advanced you will receive:

- A more detailed health questionnaire
- Clinical observations including blood pressure and key measurements
- An Advanced Blood Panel focused on important preventative health markers
- Clinical review of your results
- A personalised health report with clear recommendations
- Follow up GP video appointment if required – including onward private referral or prescription if appropriate

Your assessment will help provide greater insight into:

- **Heart and metabolic health:** Understanding factors linked with cardiovascular health and future wellbeing.
- **Lifestyle factors:** Understanding how activity, sleep, nutrition and lifestyle behaviours may influence health.
- **Preventative opportunities:** Identifying positive changes that may help maintain and improve long-term health.

Following completion of your assessment, your questionnaire, observations and blood results will be reviewed by our clinical team. You will receive your personalised report within a week of your investigations being completed.

Your report will explain:

- Your results in clear language
- What they may mean for your health
- Areas already looking positive
- Opportunities for improvement
- Recommended next steps

Our aim is to help you better understand your health today and support you in staying healthier for longer.

Demographics

Age Band

In your fifties, health risks increase meaningfully. For women, the menopause can affect heart and metabolic health. For men, changes in hormone levels can develop during this decade. Looking after your health now - through regular movement, a balanced diet and not smoking - makes a real difference. The links below have useful guidance.

Signposted services:

- NHS Male Menopause: www.nhs.uk/conditions/male-menopause/
- British Heart Foundation — Heart Health Over 50: www.bhf.org.uk/information-support/heart-matters-magazine/medical/healthy-over-50

Sex at Birth

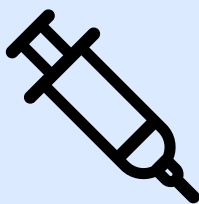

We use your biological sex to make sure we apply the right clinical measurements and thresholds to your results. Men tend to have higher cardiovascular risk at younger ages, and are less likely to seek health checks - which is exactly why this programme is valuable.

Signposted services:

- Men's Health — NHS: www.nhs.uk/mens-health/

Ethnicity

Standard population thresholds are used for your results.

Known Medical Conditions

Hypertension

You have not been diagnosed with high blood pressure. That is reassuring. Keeping active, eating well and maintaining a healthy weight are the best ways to keep your blood pressure in a healthy range. It is worth knowing your numbers though so take a moment to look at the link below.

Signposted services:

- Blood Pressure UK — Know Your Numbers: www.bloodpressureuk.org/know-your-numbers/

Hyperlipidaemia (High Cholesterol)

You have told us you have been diagnosed with high cholesterol. High cholesterol can gradually build up in the arteries over time, increasing the risk of heart attack and stroke. There is good support available to help manage this and the resources below are a helpful starting point.

Signposted services:

- Heart UK — Cholesterol Charity: www.heartuk.org.uk
- BHF — High Cholesterol: www.bhf.org.uk/information-support/risk-factors/high-cholesterol

Diabetes or Pre-Diabetes

You have not been diagnosed with diabetes or pre-diabetes. Keeping active, eating well and maintaining a healthy weight are the most effective ways to reduce your risk.

Chronic Kidney Disease (CKD)

You have not been diagnosed with chronic kidney disease. CKD can affect your blood pressure and heart health as well as your kidneys — if you are interested in learning more take a look at these links.

Signposted services:

- Kidney Care UK: www.kidneycareuk.org
- NHS — Chronic Kidney Disease: www.nhs.uk/conditions/kidney-disease/

Liver Disease or Fatty Liver

You have not been diagnosed with a liver condition.

Thyroid Disorder

You have not been diagnosed with a thyroid condition.

Anaemia or Iron Deficiency

You have not been diagnosed with anaemia or iron deficiency.

Mental Health Condition

You have not told us you have a mental health condition. There are resources below if you feel you need any mental health support in the future.

Signposted services:

- Mind: www.mind.org.uk
- Samaritans (24/7 — 116 123): www.samaritans.org

Family History

Family History of CVD Before Age 60

You have no family history of early heart disease recorded. This is a reassuring factor.

Family History of Stroke Before Age 60

A close family member has had a stroke before the age of 60. This can increase your own risk of stroke and cardiovascular problems. Keeping your blood pressure in a healthy range is particularly important. The resources below have more information and practical guidance.

Signposted services:

- Stroke Association: www.stroke.org.uk
- Blood Pressure UK: www.bloodpressureuk.org

Family History of Diabetes

A close family member has been diagnosed with diabetes. This can increase your own risk, particularly when combined with other factors such as weight, ethnicity or lifestyle. Eating well, staying active and keeping a healthy weight are the most effective things you can do to reduce this risk. The resources below can help.

Signposted services:

- Diabetes UK — Know Your Risk: www.diabetes.org.uk/preventing-type-2-diabetes/diabetes-risk-factors

Familial Hypercholesterolaemia (FH)

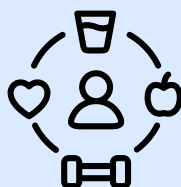

A family member has been diagnosed with familial hypercholesterolaemia (FH) — an inherited condition that causes high cholesterol from birth. This significantly increases the risk of early heart disease if not identified and treated. It is strongly recommended that you speak to your GP about getting a cholesterol blood test and a formal FH assessment. The resources below explain what this involves.

Signposted services:

- Heart UK — FH Specialist Service: www.heartuk.org.uk/fh/what-is-fh

Relevant Family History of Cancer

You do not have a relevant family cancer history recorded.

Lifestyle Factors

Smoking Status

You have never smoked. This is a significant positive for your cardiovascular and respiratory health.

Alcohol — More Than 14 Units Per Week

You drink more than 14 units of alcohol per week, which is above the UK Chief Medical Officers' low-risk guidelines. Drinking regularly above this level increases the risk of liver disease, high blood pressure, heart disease, stroke and some cancers. Support to reduce your intake is available and you do not need to stop completely to see real health benefits - take a look at this resource.

Signposted services:

- Drinkaware — Unit Calculator: www.drinkaware.co.uk/tools/unit-calculator
- Alcohol Change UK: alcoholchange.org.uk
- NHS — Alcohol Support: www.nhs.uk/live-well/alcohol-advice/alcohol-support/

Physical Inactivity

You are meeting physical activity guidelines! Regular activity is one of the most powerful ways to protect your long-term health. Keep it up.

Poor Diet

You report eating a generally healthy diet. Good nutrition is one of the cornerstones of long-term wellbeing.

Poor Sleep

You report sleeping well. Quality sleep is a powerful protector of both mental and physical health.

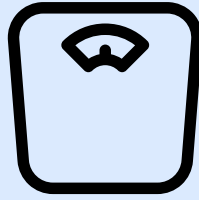

High Stress

You have told us you are experiencing high levels of stress. Ongoing stress can affect your blood pressure, heart health and metabolism, and can also make it harder to maintain healthy habits. Help is available. Addressing stress is a genuine clinical priority. Should you wish, you can discuss your stress with a qualified health professional. A GP or Mental Health Practitioner can assess you and give you advice online. This can include a referral for further talking therapy if required. Please book an appointment with Doctor Care Anywhere - [Book an Appointment | Mental Health](#). Additionally the resources below are a helpful starting point.

Signposted services:

- NHS Every Mind Matters: www.nhs.uk/every-mind-matters/
- Mind — Stress: www.mind.org.uk/information-support/types-of-mental-health-problems/stress/
- Headspace: www.headspace.com

- Samaritans (24/7 — 116 123): www.samaritans.org

Body Metrics

Body Mass Index (BMI)

Your BMI is in the overweight range. Even a modest reduction in weight — around 5 to 10% — can meaningfully improve blood pressure, cholesterol and blood sugar. The resources below include free NHS weight management support.

Signposted services:

- Medicspot — powered by Doctor Care Anywhere: [Weight Management](#)
- NHS Better Health — Lose Weight: www.nhs.uk/better-health/lose-weight/
- NHS Digital Weight Management Programme: www.england.nhs.uk/digital-weight-management/
- NHS Specialist Obesity Services (Tier 3): www.england.nhs.uk/obesity/

Waist-to-Height Ratio

Your waist-to-height ratio is within a healthy range. This is a reassuring sign that fat is not being stored around your abdomen in a way that would add extra risk.
